

The National Valve Museum

Updates July 2014

Thanks to Rob Coleman for his contribution this month of a valve article directed at guitar amplification rather than linear Hi-Fi use.

In updating the database processing software last month the cross references in the exhibits stopped working. They are now back again.

Added an article on skin effect (art-185), not directly on topic but some audio circles advocate anti skin effect measures for speaker cables.

Added a most interesting article from 1955 on small power valves. (art-186)

Exhibits as of 30/06/14 = 3740 now 3790. This includes a collection of X-Ray tubes and rectifiers from Christopher Jeffery – all with X-Ray images of the exhibits!

Adverts added: adv838 to adv878.

Keyed the table for advert adv227 American Types replaceable by Mullard Valves. This includes the exhibit references and amendments to the equivalents list.

Five time-line features added (time-074 - time-078)

Scanned and added PDF data-sheet for RG3-250 and RG3-250A
